

ABSTRACT OF THE DISCLOSURE

A multi-purpose hand shower which has a handle connectable with a source of water, a showerhead attached to the handle and formed so that water can pass through the showerhead onto a person when the person holds the handle, and an additional scrubbing element which is operative for applying to a person's body a scrubbing action which is different from a washing action of water, the additional scrubbing element being attached to the showerhead, so that when a person holds the handle in one hand, simultaneously the showerhead is held and the additional scrubbing element is held in one hand, and a person can therefore provide a flow of water from the showerhead onto a person's body and also an additional scrubbing action by the additional scrubbing element to the person's body.
